

Machine Learning

What is ML?

Machine Learning is a subset of Artificial Intelligence that focuses on the development of algorithms that can learn from and make predictions on data.

Machine Learning is a branch of computer science that enables computers to learn from data and make predictions or decisions without being explicitly programmed to do so.

Machine Learning is a process of building a model that can learn from data and make predictions or decisions. The model is trained on a dataset and then used to make predictions on new data.

Machine Learning is a process of building a model that can learn from data and make predictions or decisions. The model is trained on a dataset and then used to make predictions on new data.

Are there really many worlds in the "Many-worlds interpretation" of Quantum Mechanics? The development of «decoherence theory» revealed that, using the standard formalism of quantum mechanics, macroscopically distinct branches of the wavefunction were almost entirely free from interference and evolve approximately classically almost everywhere almost everywhere.
